# Lesson 5: Integration by Decomposition Method

| Criteria | 4 - Mastery | 3 - Proficient | 2 - Developing | 1 - Beginning |
|---|---|---|---|---|
| Initial Analysis | Correctly identifies if the function is proper or improper; performs long division if needed. | Identifies function type but makes minor errors in long division. | Attempts analysis but misses long division for improper functions. | Does not analyze function type or degree of numerator/denominator. |
| Denominator Factoring | Denominator is fully and correctly factored into linear or quadratic terms. | Mostly factored correctly; may have one minor sign error. | Factors only partially or incorrectly; lacks complete factorization. | Fails to factor denominator or uses incorrect method. |
| Setup of Decomposition | Correctly assigns variables based on factor types (linear, repeated, quadratic). | Setup is mostly correct; minor error in handling repeated or quadratic factors. | Setup is attempted but inconsistent with factor types. | Incorrect setup that ignores the structure of the factors. |

| | | | | |
|---|---|---|---|---|
| Algebraic Solving | Successfully solves for all constants using equating coefficients or "clever" substitution. | Correct process with minor arithmetic errors in constant values. | Significant errors in solving the system of equations. | Fails to solve for constants or does not show algebra. |
