

Lesson 21A: Intersection of Two Lines

Criteria	Exemplary (4)	Proficient (3)	Developing (2)	Beginning (1)
Conceptual Understanding	Deep understanding that the intersection point satisfies both equations; can identify parallel, intersecting, or coinciding lines by slopes/intercepts.	Understands that the intersection point is the solution. Identifies if lines are parallel or intersecting.	Understands that lines must cross but has difficulty relating this to the equation's slope or y-intercept.	Does not understand that intersection represents a common solution.
Algebraic Method	Accurately solves for intersection using substitution or elimination method. Shows all steps clearly.	Solves for the intersection point with minor algebraic errors. Uses appropriate methods.	Attempts to use substitution or elimination but has significant errors in the process.	Cannot set up or solve the system of equations.

Graphical Method	Accurately graphs both lines, identifies the intersection point, and uses tools to verify.	Graphs both lines correctly and identifies the intersection point, with minor inaccuracies in plotting.	Graphs lines with errors, making the intersection point hard to identify.	Unable to graph linear equations or identify the intersection.
Interpretation	Correctly interprets the solution in context, including distinguishing between no solution, one solution, and infinitely many solutions.	Correctly states the coordinates of the intersection point as the solution, including identifying parallel lines.	Identifies an intersection point, but struggles to explain what it means.	Cannot interpret the results of the calculation.
Verification	Validates the intersection point by substituting it back into both original equations.	Substitutes the point into one equation to check.	Attempts to verify but makes errors in calculation.	Does not verify the solution.
