

Lesson 21B: System of Two Linear Equations and Addition Method

Criteria	Proficient (3 pts)	Developing (2 pts)	Novice (1 pt)
Setup & Organization	Equations are arranged in standard form ($Ax + By = C$) with variables lined up perfectly.	Equations are generally arranged, but minor alignment errors make the process confusing.	Equations are not in standard form; variables are not aligned.
Preparation (If needed)	Multiplies one or both equations correctly to create opposite coefficients.	Attempts to multiply but makes errors in distributing to all terms.	Does not prepare equations; attempts to add without creating opposites.
Elimination Method	Correctly adds/subtracts equations to eliminate one variable.	Eliminates a variable but makes a sign error or calculation error.	Variable is not eliminated; coefficients are not opposites.

Solving for Variables	Correctly solves for the first variable, then substitutes back to find the second.	Makes a calculation error when solving for the first or second variable.	Unable to solve for either variable after elimination.
-----------------------	--	--	--

Final Solution & Check	Expresses solution as a correct ordered pair (x, y) and verifies by checking.	Incorrect ordered pair, or does not check, but steps were mostly correct.	No solution provided or solution does not satisfy either equation.
