

Lesson 6: Equations of Lines

Criteria	Exemplary (4)	Proficient (3)	Developing (2)	Beginning (1)
 Identifying Slope & Intercepts	Correctly identifies slope (m) and y-intercept (b) from equations, graphs, or points with no errors.	Identifies slope and y-intercept correctly with 1-2 minor errors.	Identifies slope or y-intercept correctly with 3-4 errors.	Misidentifies both slope and y-intercept frequently.
 Writing Equations	Writes equations in slope-intercept, point-slope, or standard form correctly based on given information.	Writes equations correctly with 1-2 minor algebraic errors.	Writes equations with multiple errors in form or structure.	Unable to write equations; confusion between forms.
 Graphing Lines	Graphs lines accurately, including proper plotting of intercept, slope, and labeling.	Graphs lines accurately with minor plotting errors or lack of labels.	Graphs lines with significant errors (e.g., swapped axis, wrong slope direction).	Cannot graph a line from an equation.
 Conceptual Understanding	Deep understanding of horizontal ($m = 0$), vertical ($m = \text{undefined}$), parallel, and perpendicular slopes.	Strong understanding with slight confusion between parallel/perpendicular scenarios.	Some understanding, but confuses horizontal/vertical lines.	Limited understanding of different types of slopes.
 Modeling & Application	Models real-world scenarios perfectly, defining variables and interpreting the slope/intercept accurately.	Models scenarios well with minor errors in interpretation or variable definition.	Attempts to model, but equation does not fit the scenario correctly.	Cannot translate a real-world problem into an equation.
