

Lesson 1: Solving Linear Equations

Criteria	Proficient (4)	Developing (3)	Novice (2)	Not Evident (1)
Procedural Accuracy	Solves equations without errors. Consistently applies inverse operations.	Solves equations with minor arithmetic errors, but methods are correct.	Makes errors in inverse operations or misses steps, leading to incorrect solutions.	Procedural errors prohibit finding the correct answer.
Multi-Step & Algebraic Manipulation	Efficiently simplifies expressions, distributes, and collects like terms before solving.	Handles multi-step problems but may fail to simplify one side completely.	Struggles to manage variables on both sides or requires hints to start.	Unable to rearrange the equation to isolate the variable.
Conceptual Understanding	Recognizes and explains one solution, no solution, or infinitely many solutions.	Understands the solution type but cannot articulate <i>why</i> .	Confuses "no solution" (e.g., $0 = 5$) with $x = 0$.	No concept of what a "solution" represents.

Verification &
Checking

Consistently checks the
solution by substituting
back into the original
equation.

Attempts to check work but
makes errors in substitution.

Rarely checks work unless
prompted.

Does not check work.
