

Lesson 10: Geometric Series

Assessment Criteria Rubric

- **Convergence Identification:** Correctly determines if the series converges by checking if the absolute value of the common ratio is less than one ($|r| < 1$).
- **Parameter Identification:** Correctly identifies the first term (a_1) and the common ratio (r) from the given series or sequence.
- **Formula Application:** Correctly substitutes a_1 and r into the sum formula $S = a_1/(1 - r)$
- **Calculation Accuracy:** Accurately computes the final sum, handling fractions, decimals, or negative ratios.
- **Interpretation and Modeling:** Interprets the meaning of the infinite sum, including converting repeating decimals or solving word problems involving infinite sums (e.g., pendulums, interest).
